AMENDMENTS TO THE CLAIMS

1-48. (CANCELLED)

49. (ORIGINAL) A method of conditioning flowing fluid comprising the

steps of:

generating a temperature gradient in a thermoelectric device between one surface

and an opposing surface; and

flowing fluid along first and second heat exchangers formed about an axis and

configured such that the fluid flows along the first heat exchanger and along the second

heat exchanger generally away from the axis, the first heat exchanger in thermal

communication with the one surface, and the second heat exchanger in thermal

communication with the opposing surface, wherein at least one of the first and second

heat exchangers are formed to provide thermal isolation in the direction of fluid flow

between a plurality of segments of the at least one heat exchanger.

50. (ORIGINAL) The method of Claim 49, further comprising rotating the

heat exchangers and thermoelectric device about the axis during operation, the heat

exchangers operating to induce fluid flow through the heat exchangers.

51. (ORIGINAL) The method of Claim 49, wherein the heat exchangers and

thermoelectric device are stationary, further comprising generating fluid flow along at

least one of the first and second heat exchangers by rotating an auxiliary fan about the

axis.

52. (ORIGINAL) The method of Claim 49, wherein at least one of the first

and second heat exchangers is formed in segments to provide the thermal isolation in the

direction of fluid flow.
